How do I track unweighted grades and missing assignments

To fill the planner accurately, I need your syllabus grading rules, assignments, deadlines, and current scores. Those details haven't been supplied yet, so I won't invent course data.

The current planner supports weighted categories, deadline tracking, study-schedule proposals, and a submission checklist. It does not yet include a dedicated unweighted-grade mode, individual missing-assignment status, or a target-grade calculator. Below is how to populate it, test it, and handle those limitations.

1. Fill in the planner from your syllabus

Use this template for each course. Paste the relevant syllabus text instead if that is easier.

```
COURSE
Course name:
Term:
Deadline timezone:
Desired final percentage:
Letter-grade thresholds:
Rounding policy:

GRADING MODEL
Choose: weighted categories / total points / equal-weight assignments

If weighted:
Category | Weight % | Current category average, if known

If total points:
Total course points possible, if known:

ASSIGNMENTS
Title | Category | Due date and time | Points possible |
Points earned, if graded | Submission status | Estimated hours
```

```
SPECIAL RULES
Dropped scores:
Late penalties:
Missing-work policy:
Extra credit:
Required-to-pass assignments or exams:
Resubmission rules:

FINAL DELIVERABLE REQUIREMENTS
Required files:
Rubric requirements:
Submission location:
Required milestones:
```

Omit student IDs, account credentials, and private information about other students.

Map those details into the existing planner

Syllabus detail	Planner location	Important limitation
Course and assignment title	Assignments and final deliverables	Use consistent course names
Deadline	Deadline field	Current field stores a date, not a time or timezone
Estimated work	Estimated hours	Enter remaining effort—not effort already completed
Urgency	Priority	Scheduling sorts by deadline first, then priority
Category weight and current average	Weighted grade tracker	Enter one row per category, not per assignment
Required submission checks	Final submission checklist	Current checklist is global, not assignment-specific

For requirements not represented by fields, keep them in your syllabus audit notes. Do not silently discard late penalties, dropped-score rules, mandatory exams, or minimum-score requirements.

2. Test the HTML planner in your browser

Use fictional test data first so you can distinguish a software problem from an unusual syllabus rule.

Open it and inspect errors

1. Open the HTML planner attachment in your browser.
2. Confirm that the page displays its assignment, timeline, grade, and checklist sections.
3. In Chrome, open the Console:
    - Windows/Linux: `Ctrl + Shift + J`
    - Mac: `Cmd + Option + J`

4. Watch for errors while performing the tests below. These are Chrome's documented Console shortcuts. [1]

I have not operated your browser or completed these tests on your computer.

Run this acceptance checklist

Test	Input/action	Expected result
Add a deliverable	"Practice project," future deadline, 3 hours, High	Appears in the table and timeline
Complete a deliverable	Check its completion box	Timeline marks it complete; it is excluded from a newly generated schedule
Grade calculation	Category A: 40% weight, 80% average; Category B: 60% weight, 90% average	Displays 86% with 100% of syllabus weight represented
Unknown grade	Remove Category B; add it again with its average blank	Displays 80% on known categories and 40% represented weight
Zero versus blank	Enter Category B average as 0	Displays 32%; zero must not be treated as unknown
Invalid weight total	Enter weights totaling 90%	Displays a weight-total warning
Capacity overflow	Add more work than can fit before the deadline	Displays unscheduled hours requiring review
Past deadline	Add an unfinished assignment due yesterday	Flags unscheduled work rather than placing it in the past
Persistence	Add data, then reload	Data remains, or the page explicitly reports a saving problem
Backup	Export JSON, then import the backup	Data is restored after replacement confirmation
Keyboard access	Navigate with Tab and activate controls	Controls have visible focus and usable labels

Check these known limitations

- Changing an assignment's completion status does not automatically recalculate an already displayed study schedule. Click "Propose study schedule" again.
- The current interface has no assignment edit/delete controls. Check details carefully before entering real data.
- Saved data depends on browser storage. Keep a JSON backup rather than treating browser persistence as your only copy.
- Date-only deadlines cannot verify a syllabus deadline such as "11:59 p.m. Central."
- The checklist is not proof of submission. Save and verify the receipt in the authoritative course system.

Passing this checklist establishes a limited local-browser result—not full accessibility, security, or production readiness.

3. Track unweighted grades correctly

“Unweighted” can mean two different models. They must remain distinct.

Total-points grading

Calculate:

$$
\begin{aligned}
&[\\
&\text{Current percentage}\\
&100\times\\
&\frac{\text{points earned on included assignments}}\\
&{\text{points possible on included assignments}}\\
&]
\end{aligned}
$$

Assignments worth more points contribute more to the result. Canvas’s non-category-weighted totals use points earned divided by points possible, rather than a simple average of assignment percentages.[2]

For illustration:

- Assignment A: 18/20.
- Assignment B: 70/100.
- Total-points grade: $88/120 = 73.33\%$.

Equal-weight assignments

If the syllabus gives every assignment equal weight regardless of its point value, average their percentages:

$$
\begin{aligned}
&[\\
&\text{Current percentage}\\
&\frac{\sum \text{assignment percentages}}\\
&{\text{number of included assignments}}\\
&]
\end{aligned}
$$

For the same illustrative scores, the equal-weight average is 80%. That differs from the total-points result because the assignments now contribute equally.

What to do in the current planner

For display only, you can enter a single grade category:

```
Category: Overall current grade — calculated externally
Weight: 100%
```

```
Current average: your verified current percentage
```

This is a workaround, not individual-assignment tracking. It also makes the planner show 100% represented category weight, which must not be interpreted as “all coursework is graded.”

For accurate unweighted tracking, use a separate assignment ledger until the planner has a native points/equal-weight mode.

4. Track missing assignments without turning every blank into zero

Use **status** separately from score.

Assignment state	Score entry	Treatment
Not due	Blank	Future work; do not assume zero
Submitted, awaiting grading	Blank	Pending score
Graded	Actual score, including zero	Include according to the grading rules
Overdue, not submitted	Blank unless a zero is confirmed	Flag as missing; calculate a separate zero scenario if needed
Excused	No score	Exclude according to the course policy
Dropped	Preserve the original score	Exclude only after applying the syllabus’s drop rule

LMS settings can apply missing-work grades, and an excused assignment can be excluded from the final-grade calculation. Therefore, the instructor’s policy and authoritative gradebook—not the word “missing” alone—determine the calculation. [3]

Keep two views:

1. Current graded result: based on confirmed, included scores.
2. Missing-as-zero scenario: shows the impact if unresolved work receives zero.

The existing completion checkbox cannot distinguish “submitted,” “graded,” “excused,” and “missing.” Do not use it as a substitute for those states.

5. Calculate weight-adjusted score targets

For a weighted course, this simple target calculation works when the completed portion is final and the remaining weight is known:

$$
[
\text{Required average on remaining work}
\frac{T-E}{R}
]
$$

Where:

- T is the desired final percentage.

- E is the percentage-point contribution already secured.
- R is the remaining course weight expressed as a fraction.

Illustrative example: a final 85% target, 50 percentage points already secured, and 40% of the course remaining:

$$\frac{85 - 50}{0.40} = 87.5\%$$

You would need an 87.5% average on the remaining portion.

Do not use a current category average as a “secured” contribution if more assignments will still change that category. Dropped scores, extra credit, penalties, and required-to-pass assessments also need separate handling.

The current planner does not compute this target automatically.

6. Turn final requirements into a deliverable audit

For each project, use this sequence:

1. Extract every syllabus and rubric requirement.
2. Assign each requirement to a specific file, section, milestone, or submission.
3. Record deadline time, timezone, submission location, and permitted format.
4. Break remaining work into preparation, drafting, review, and submission tasks.
5. Verify citations, academic-integrity rules, accessibility, and required content.
6. Open the final files and check that they are the intended versions.
7. Submit through the official course system.
8. Save the receipt and verify that the correct files were received.

Keep “work finished,” “submitted,” and “submission verified” separate.

Paste one course’s syllabus grading section and assignment list, plus your current scores and desired final grade, using the template above. That will let me map the actual requirements into the planner and calculate defensible score targets.
