perplexity

Generate sample course data to test the dashboard

Add a target grade calculator script to the planner
Export the dashboard checklist to a markdown file
Include late penalty rules in the grade calculator
Show me how to format syllabus text for the template

Generated all five deliverables, including an updated standalone dashboard with fictional course data, target-grade calculations, and late penalties.

The **dashboard** replaces the earlier local prototype; I did not patch the previous file because it was unavailable in this session.

What's included

Deliverable	Contents
Updated interactive HTML dashboard	Sample courses, editable targets and scores, deadlines, assignment statuses, late penalties, missing-as-zero scenarios, and a deliverable checklist
Sample course-data JSON	Three fictional courses covering equal-weight, total-points, and weighted-category grading
Target-grade calculator JavaScript	Reusable calculation functions, also embedded in the HTML
Markdown checklist	Syllabus audit, penalty verification, browser tests, and final-submission checks
Markdown syllabus template	A fully formatted fictional syllabus example you can replace with real details

All files were generated and verified as non-empty. The JavaScript and browser behavior have not been executed or tested, so the expected results below are acceptance-test targets—not reported test passes.

1. Sample data and expected results

The dashboard starts with these fictional courses:

Course	Grading model	Late-rule example	Expected result
Sample Writing Seminar	Two equally weighted assignments	Essay: 90/100, one day late, deduct 10% of earned score	Adjusted essay: 81/100; remaining assignment needs 89% for an 85% final
Sample Data Science	300 total course points	Notebook: 45/50, two days late, deduct 5% of possible points per day	Adjusted notebook: 40/50; current graded average: 80%; final analysis needs 90%

Course	Grading model	Late-rule example	Expected result
Sample Product Studio	Research 30%, Prototype 40%, Final 30%	Research: 90/100, one day late, deduct 5 percentage points	Adjusted research: 85/100; remaining work needs an 85% weighted average

The examples use October 2026 deadlines. Late days are entered manually; the dashboard does not calculate them from the current date.

2. Target-grade calculator

The calculator supports:

- Equal-weight assignments.
- Total-points grading.
- Weighted categories, using points within each category.
- A desired final percentage.
- The average needed across remaining work.
- An infeasibility warning when the required remaining average exceeds 100%.
- A separate scenario that treats missing assignments as zero.

Its core calculation is:

[
Required remaining average

100\times\frac{target percentage-secured percentage points}
{remaining course weight in percentage points}
]

For example, if you have secured 25.5 percentage points toward an 85% target and 70 percentage points of course weight remain:

$$100 \times \frac{85 - 25.5}{70} = 85\%$$

Important interpretation

The displayed assignment target is a common-score scenario, not a unique minimum for every assignment. You can score higher on one remaining assignment and lower on another while reaching the same final result.

Targets are expressed as scores after any penalty. The calculator does not automatically reverse future penalties to tell you the raw score you would need.

Final targets also require the complete assignment inventory. Otherwise, the remaining denominator can be wrong.

3. Late-penalty rules

The calculator includes three daily penalty models:

Rule	Deduction basis	Example
Percentage of earned score	Deduct from the original earned points	90 points, 10% per day, one day late → 81 points
Percentage of possible points	Deduct from the assignment's maximum points	45/50, 5% per day, two days late → 40/50
Percentage points	Reduce the assignment percentage	90%, minus 5 percentage points → 85%

The deductions are linear, not compounded. Percentage-of-possible and percentage-point rules produce equivalent results when converted to assignment points, but remain separately labeled to match syllabus wording.

Additional controls include:

- Chargeable late days.
- Daily rate.
- Maximum total deduction.
- A zero-score floor.
- "Already adjusted," which bypasses another deduction.

Use "already adjusted" when your entered grade already includes the instructor's late penalty.

Policies still requiring manual handling

The prototype does not automate:

- Grace periods or partial-day rounding.
- Hard submission cutoffs.
- Approved extensions.
- Compounding penalties.
- Extra credit.
- Automatic dropped-score selection.
- Required-to-pass assessments.
- Final-grade rounding.

Record those rules in the syllabus template and apply them deliberately rather than assuming the calculator covers them.

4. How to format your syllabus text

Use clear headings, one rule per line, and one assignment per row. Here is the abbreviated structure:

```
Course: Product Studio
Grading model: weighted categories
Within-category calculation: points earned / points possible
Target final percentage: 85
Deadline timezone: America/Chicago
Rounding: none

CATEGORIES
Research | 30%
Prototype | 40%
Final | 30%

ASSIGNMENTS
Title | Category | Due date/time | Possible | Earned | Status
Research report | Research | 2026-10-12 23:59 | 100 | 90 | graded
Prototype | Prototype | 2026-10-21 23:59 | 100 | blank | pending
Final presentation | Final | 2026-10-30 23:59 | 100 | blank | pending

LATE POLICY
Basis: percentage points
Rate: 5 per chargeable day
Grace period: none
Day rounding: round started late days up
Cap: 20 percentage points
Scores already include penalties: no

OTHER RULES
Dropped assignments: none
Extra credit: none
Mandatory-pass requirements: none
```

Use `blank` for unknown scores and `0` only for a confirmed zero. Keep `pending`, `missing`, `graded`, `excused`, and `dropped` distinct.

The Markdown template is an intake document—not an automatic syllabus parser. The dashboard accepts its JSON data structure through the import control; pasting Markdown into it will not populate courses.

5. Browser verification sequence

Open the updated HTML and run these checks before replacing the sample data:

1. Confirm the three sample results match the table above.
2. Change a target from 85% to 90%; confirm the required remaining average rises.
3. Mark an ungraded assignment `missing`; compare the result with the missing-as-zero switch off and on.

4. Enable “already adjusted” on a scored assignment; confirm the penalty is no longer deducted.
5. Enter invalid values, such as a score above the possible points or fractional late days; confirm the calculation reports a problem.
6. Export a backup, reload, and import it again.
7. Test keyboard navigation and narrow-screen table scrolling.

Course data saves locally when browser storage is available. Checklist selections are session-only, and this replacement does not retain the earlier weekly study-scheduling feature. No LMS, calendar, institutional record, or external service was changed.
