build outline detail expand enhance company instuition admin investor board and alumni workspaces

Semester should build six connected workspaces—Company, Institution, Administration, Investor, Board, and Alumni—on one shared identity, Action Center, search, workspace, education graph, and policy-controlled AI layer. Their distinction should be authority and daily work, not separate products.

The organizing principle is **separation**: separate audiences, permissions, records, and decision rights while connecting the workflows that legitimately cross those boundaries.

Below is an expanded product and implementation blueprint. It is proposed design, not a claim that these capabilities have been implemented or deployed.

1. Starting point and evidence boundaries

Your existing Semester OS map already includes company operations, institutional governance, an Operations Command Center, investor/board reporting, and career/alumni capabilities. It also specifies a shared identity-to-policy-to-audit control chain and domain-by-domain migration. Build on that structure rather than introducing six independent dashboard systems. [1]

The uploaded architecture snapshot, measured October 4, 2026, reports incomplete platform adoption, tenant-AI-policy enforcement gaps, database-function isolation risks, and a company-OS phase marked “not started.” Treat these as dated reported findings—not a fresh inspection of the active repository or production environment. [2]

The existing investor and institution decks also use language such as “never replacing” legacy systems, while the master OS map explicitly describes progressive replacement with evidence. Reconcile those documents: the institutional pilot can operate alongside existing systems without limiting Semester’s long-term native replacement architecture. Deck statements about contracts, traction, security, or financials should not become dashboard facts without independent evidence. [3] [4] [1]

2. Define the six workspaces clearly

Workspace	Primary users	Principal job	Authority boundary
Company	Semester leadership, employees, contractors	Build, sell, deliver, finance, and operate Semester	Company business records; no default access to institution records

Workspace	Primary users	Principal job	Authority boundary
Institution	Presidents, provosts, deans, institutional sponsors, governance stewards	Set institutional objectives, oversee outcomes, authorize adoption	Institution-scoped governance and approved aggregate reporting
Administration	IT, registrar administrators, privacy/security staff, implementation operators	Configure, provision, integrate, migrate, support, and maintain	Explicit operational capabilities within assigned scope
Investor	Approved current investors and separately authorized prospective investors	Understand performance, risk, funding needs, and evidence	Published, audience-approved disclosure; no operational control
Board	Directors, authorized observers, committee members, corporate secretary	Exercise formal oversight and maintain governance records	Board-specific information and authorized governance workflows
Alumni	Graduates, lifelong learners, mentors, chapter leaders	Maintain identity, relationships, career evidence, and lifelong engagement	Personal control and explicitly granted community/relationship access

Institution and Administration should share an institutional tenant, but not interchangeable privileges. Investor and Board should share a reporting foundation, but not interchangeable disclosure rights.

Also distinguish Semester's corporate board from an institution's governing board. Institutional trustees belong to that institution's governance scope; they do not gain access to Semester corporate board materials.

3. Shared workspace foundation

Your master map calls for one app shell, identity system, policy system, audit system, and workflow engine, while allowing role-specific workspaces. Use that as the implementation contract.[5]

Shared interface

Every workspace should reuse:

- Workspace switcher showing organization, role, and scope.
- Home view: what changed, what needs attention, and what is blocked.
- Action Center with assigned tasks, approvals, deadlines, and escalations.
- Search restricted to authorized sources.
- Documents, files, projects, calendar, and communication.
- Object detail panels with ownership, provenance, status, and related records.
- Activity history and durable action receipts.
- Bounded AI assistance.
- Notification preferences, accessibility settings, and support.

The workspace switcher must change authorization context—not merely the navigation menu.

Shared record envelope

Every consequential object should carry:

```
object_id
object_type
owning_organization_id
institution_id, when applicable
scope_type + scope_id
owner_id
classification
source_system + source_record_id
source_authority
version + effective_at
workflow_state
required_capability
approval_policy_id
retention_policy_id
evidence_links
created_at + updated_at
```

Use separate fields for owning organization, institutional scope, and published audience. An investor's membership in an investment firm must never imply membership in a university tenant.

4. Company workspace: Semester's execution system

Navigation and capabilities

Area	Expanded capabilities	Principal output
Executive overview	Objectives, operating scorecard, blockers, commitments, capacity	Weekly execution brief
Product and engineering	Requirements, roadmap, release readiness, quality, customer feedback	Evidence-backed release decisions
Sales and partnerships	Accounts, contacts, discovery, opportunities, proposals, procurement	Qualified institutional pipeline
Implementation and success	Mutual action plans, onboarding, launch gates, adoption, renewals	Customer readiness and value evidence
Finance	Budgets, collections, reconciled actuals, forecasts, runway scenarios	Reviewed financial package
People	Hiring plans, role requests, onboarding, training, access lifecycle	Accountable staffing and access
Legal and procurement	Agreements, renewals, obligations, vendor reviews	Controlled contract register
Trust and operations	Incidents, risks, controls, vulnerabilities, support, reliability	Owned remediation and operating evidence

Area	Expanded capabilities	Principal output
Reporting	Investor updates, board packages, disclosure review	Approved reporting snapshots

The existing GTM playbook already connects discovery, pilot design, procurement, implementation, outcome review, annual conversion, and expansion. Reconcile those records into the Company workspace rather than building another disconnected CRM or pilot tracker. [6]

Core workflow

Institutional opportunity
→ qualified discovery
→ agreed scope and success criteria
→ commercial and trust review
→ implementation workspace
→ launch approval
→ measured outcomes
→ renewal or expansion decision.

Each handoff must preserve scope, obligations, owners, evidence, and unresolved risks.

Enhancements

- Commitment ledger connecting sales promises to product and delivery owners.
- Capacity planning that shows implementation demand against available staffing.
- Risk-linked roadmap: unresolved risks remain attached to releases and customer commitments.
- Customer 360 combining contract, implementation, support, adoption, and renewal context without indiscriminately exposing student records.
- Publication studio that prepares investor and board disclosures from reviewed source records.

Acceptance criteria

- A signed commitment has an owner, delivery milestone, and source agreement.
- Forecasts cannot overwrite reconciled actuals.
- Sales stages require stage-specific evidence.
- Restricted support access is approved, time-limited, and audited.
- A published report can be traced to its source versions and reviewers.

5. Institution workspace: strategy, stewardship, and outcomes

This workspace answers: “Is Semester helping our institution, what have we authorized, and what needs leadership attention?”

Navigation and capabilities

1. Institutional overview
    - Approved objectives, participating units, adoption, service health, and unresolved decisions.
    - Aggregate outcomes with definitions, reporting windows, and limitations.
2. Academic and student-success oversight
    - Program-level planning, registration-readiness, learning, advising, and support outcomes.
    - Cohort comparisons only within approved reporting policies.
    - Clear separation between descriptive trends and demonstrated causal impact.
3. Governance
    - Policy ownership, proposals, reviews, approvals, exceptions, and effective dates.
    - Decision records showing authority, rationale, evidence, and review deadlines.
4. Implementation and migration
    - Domain readiness, source ownership, integration quality, reconciliation, cutover approvals, and rollback readiness.
    - Native replacement decisions by domain—not a single institution-wide “live” label.
5. Trust and institutional assurance
    - Relevant security, privacy, accessibility, incident, and vendor evidence.
    - Open findings and remediation ownership.
6. Commercial relationship
    - Contracted scope, entitlements, implementation responsibilities, service reviews, renewals, and portability.
7. Institutional communication
    - Approved launch notices, policy updates, service changes, and executive briefings.

These areas extend the institutional control-plane and migration domains already present in the master map. [1]

Important design distinction

Institutional leaders should see approved evidence and decisions. They should not automatically receive access to individual advising notes, student-private work, sensitive cases, or operational configuration.

Acceptance criteria

- Every outcome card shows its definition, denominator, reporting period, source, and freshness.
- Small or sensitive cohorts follow an institution-approved disclosure policy.
- Policy changes preserve prior versions and effective dates.
- Official-record authority is identified separately for each domain.
- Institutional approval records identify the approving person and their authority.

6. Administration workspace: the operational control plane

This workspace answers: “What must I configure, review, execute, reconcile, or recover?”

Navigation and capabilities

Area	Required functions
Identity and access	SSO setup, provisioning, memberships, role assignments, scoped capabilities, access reviews
Organization	Institution hierarchy, campuses, departments, programs, delegated administration
Policy and configuration	Module modes, feature policies, AI policies, workflow configuration, approval rules
Integrations	Connection reviews, mappings, sync schedules, errors, source freshness, credential references
Migration	Staging, validation, dual-run comparisons, reconciliation, approved cutover, rollback
Operational queues	Failed jobs, exceptions, support escalations, pending approvals, release-impact tasks
Privacy and records	Data requests, retention, legal holds, approved export and deletion workflows
Security	Alerts, privileged access, incident handling, break-glass review
Audit	Searchable actions, approvals, execution receipts, source changes
Offboarding	Access removal, integration shutdown, portability, contractual retention and deletion

Your existing architecture describes a command boundary with authenticated tenant resolution, policy decisions, idempotency, audit, and an outbox. It also reports that portions of this spine were not yet mounted or enforced in the dated snapshot. Administration actions should depend on verified enforcement, not the mere presence of those libraries. [2]

Controlled-action lifecycle

Request
→ permission and scope check
→ impact preview
→ required approval
→ execution
→ durable receipt
→ read-back verification

→ reconciliation
→ closure or exception.

High-risk action controls

Use explicit gates for:

- Privilege elevation.
- Official-record writes.
- Bulk imports and exports.
- Integration replay.
- Data deletion.
- Provider or AI-policy changes.
- Domain cutover.
- Emergency access.

Require reason codes, exact affected scope, appropriate authentication, and approval according to risk. Recovery must distinguish reversible configuration changes from actions that require compensating transactions or institutional correction.

Acceptance criteria

- Client-supplied tenant identifiers cannot establish authority.
- Permission checks apply to APIs, database functions, jobs, storage, and search.
- Retried commands cannot duplicate consequential effects.
- Failed operations retain enough context for safe review.
- Emergency access expires and receives retrospective review.

7. Investor workspace: controlled disclosure and assistance

The Investor workspace should provide a concise, read-mostly account of company performance—not a window into operating systems.

Navigation and capabilities

- Monthly updates.
- KPI scorecard.
- Cash, collections, burn, and scenario runway.
- Commercial pipeline and institutional traction.
- Product and implementation milestones.
- Material risks and mitigations.
- Management requests for introductions or assistance.

- Audience-scoped data room.
- Questions and management responses.
- Subscription and notification preferences.

Metric contract

Every published metric should include:

```
metric definition and version
reporting period
value and unit
actual / forecast / illustrative classification
comparison basis
source references
preparer and reviewer
publication version
approved audience
```

Keep recurring revenue, implementation fees, pilot fees, bookings, collections, and recognized revenue distinct. The existing board deck itself separates pilot services from contracted ARR and labels some financial figures as sample; retain that discipline rather than publishing presentation figures as live financial truth.[7]

Publication workflow

Prepare source snapshot
→ reconcile financials
→ review metric definitions
→ redact restricted information
→ approve recipient groups
→ publish immutable package
→ notify authorized recipients
→ record corrections as a new version.

Enhancements

- “What changed?” summaries tied to the prior reporting package.
- Actual-versus-plan explanations with accountable owners.
- Requests that investors can accept without gaining access to internal CRM records.
- Separate diligence rooms for prospective investors.
- Expiring document access and recipient-specific download policies.

Acceptance criteria

- Investors cannot browse operational student or institution records.
- Prospective investors do not automatically inherit existing-investor access.
- Revoked users lose document, search, preview, and AI retrieval access.
- Every financial figure retains its reporting basis and review evidence.
- A corrected package preserves the historical publication record.

8. Board workspace: governance, not an expanded investor dashboard

Board members may receive deeper disclosures and formal decision workflows. Those rights must be explicit and reviewed; board membership must not imply platform-administrator access.

Navigation and capabilities

1. Meeting center
    - Agendas, schedules, materials, attendance, and preparation tasks.
2. Board packages
    - Financials, operating performance, strategy, material risks, and management recommendations.
3. Decisions and resolutions
    - Proposed decisions, supporting evidence, recorded outcomes, and follow-up obligations.
4. Minutes and action register
    - Draft review, approved minutes, assigned actions, due dates, and completion evidence.
5. Committees
    - Committee-specific membership, materials, reports, and delegated responsibilities.
6. Conflicts and restricted sessions
    - Disclosure records, recusals, restricted materials, and executive-session access.
7. Governance library
    - Approved policies, governing documents, prior resolutions, and relevant corporate records.

Decision model

```
decision_id
governing_body
authority_basis
proposal_version
eligible_participants
conflicts_and_recusals
```

```
required_decision_process
supporting_material_versions
recorded_outcome
effective_date
follow_up_owner
approved_record
```

The corporate secretary and counsel should validate formal approval, consent, voting, quorum, signature, and retention workflows against Semester's governing documents before activation. Until validated, use a decision-preparation and recordkeeping workflow rather than claiming legally effective automated governance.

Acceptance criteria

- Observers and committee members receive only explicitly permitted materials.
- Restricted sessions remain absent from unauthorized search and notifications.
- Minutes and resolutions preserve approved versions.
- Decisions link to the materials actually reviewed.
- Formal governance actions have validated authority and process.

9. Alumni workspace: a lifelong relationship layer

Alumni should remain part of Semester's identity and education graph without retaining expired student or employee privileges.

Your master map already connects alumni to mentoring, career evidence, continuing education, microcredentials, and lifelong learning. Extend that continuity rather than creating a separate alumni directory application.[1]

Navigation and capabilities

Area	Expanded capabilities
Alumni home	Relevant opportunities, relationships, events, and personal next actions
Identity and profile	Verified affiliation, graduation context, visibility controls, updated contact information
Career and portfolio	User-owned evidence, resumes, credentials, opportunities, career transitions
Mentoring	Availability, matching preferences, requests, boundaries, appointments, feedback
Network and chapters	Opt-in directory, professional groups, local chapters, interests, moderation
Events	Reunions, career events, chapter gatherings, volunteering
Lifelong learning	Continuing education, microcredentials, learning plans, renewal reminders
Employer participation	Verified employer role, approved opportunity posting, recruiting workflows
Giving and service	Approved contribution handoffs, volunteering, scholarships, institutional engagement
Privacy and portability	Visibility, communication preferences, export, revocation, account recovery

Graduation transition

Graduation or affiliation change
→ verify the applicable lifecycle event
→ explain which services and privileges change
→ preserve eligible personal work
→ remove expired institutional access
→ invite optional alumni participation
→ establish explicit directory and mentoring visibility.

Do not make directory inclusion, fundraising contact, or recruiter visibility automatic consequences of graduation.

Enhancements

- Multiple affiliations within one account.
- Mentor availability that expires unless renewed.
- Evidence-backed professional profiles with clear verification labels.
- Career re-entry and career-change journeys.
- User-controlled introduction requests instead of unrestricted contact harvesting.
- Separate advancement-staff access from alumni community access.

Acceptance criteria

- Alumni verification does not grant access to former classmates' educational records.
- Graduation removes expired roles while preserving permitted personal content.
- Directory visibility and communication choices are independently configurable.
- Mentoring includes blocking, reporting, and support escalation.
- Donations and recruiting permissions cannot expand academic-data access.

10. Connect the workspaces through shared workflows

Workflow	Connected workspaces	Shared object	Critical boundary
Institution adoption	Company ↔ Institution ↔ Administration	Implementation plan	Contract scope is not technical authorization
Domain replacement	Institution ↔ Administration ↔ Company operations	Migration decision	Authority changes only after validated approval
Monthly reporting	Company → Investor and Board	Reporting package	Separate disclosure audiences
Board follow-up	Board → Company	Governed action	Formal decision is distinct from execution
Alumni mentoring	Alumni ↔ Career/student services	Mentoring relationship	Scoped sharing, not student-record access

Workflow	Connected workspaces	Shared object	Critical boundary
Alumni recruiting	Alumni/employer ↔ Institution	Opportunity	Employer verification and approved access
Incident response	Administration ↔ Company ↔ Institution	Incident and notices	Audience-specific detail and restricted evidence

Use one workflow engine and linked objects, but do not use one universal permission level.

11. Data and AI architecture

Canonical record families

Reconcile these concepts against existing tables before adding anything:

- Organizations, institutional hierarchy, identities, memberships, affiliations.
- Roles, capabilities, resource scopes, access grants.
- Tasks, projects, workflow instances, approvals, receipts.
- Institutional accounts, opportunities, agreements, implementation plans.
- Policy versions, migration runs, reconciliation results.
- Metrics, source snapshots, forecasts, reporting packages, disclosures.
- Meetings, governance decisions, minutes, committee memberships.
- Alumni profiles, directory preferences, mentoring relationships, opportunities.
- Consent, provenance, audit, retention, and release evidence.

Your execution specification explicitly requires reconciliation with canonical models and warns against duplicating tables or workflows before inventorying existing equivalents. [5]

AI permissions by workspace

Workspace	Permitted assistance	Required boundary
Company	Draft plans, synthesize approved business records, identify blockers	No autonomous commitments or privileged access
Institution	Explain authorized aggregate outcomes and policies	No unsupported causal claims or hidden individual profiling
Administration	Explain errors and prepare controlled changes	Execution remains permissioned and approved
Investor	Explain published packages	No retrieval from unpublished operational sources
Board	Summarize authorized materials and draft preparation notes	No substitution for director judgment or formal approval
Alumni	Career help, learning plans, mentoring preparation	User-controlled sharing and verified-source labels

Enforce policy before retrieval, before model invocation, and before tool execution. The dated architecture snapshot specifically reports a tenant-AI-policy enforcement gap; this is an

activation blocker to verify and resolve, not a control to assume already works. [2]

12. Execution sequence, owners, and activation gates

These are proposed delivery waves, not promises about dates or current completion.

Wave	Deliverable	Accountable role	Dependencies	Exit evidence
0	Reconciled workspace and capability inventory	Product + engineering leads	Repository, database, deployment inspection	Existing/gap/duplicate register
1	Shared workspace spine	Platform + security leads	Canonical tenancy and policy model	Isolation, revocation, audit, search and AI tests
2	Company-to-institution adoption workflow	Revenue + implementation leads	Workflow engine and scoped records	One complete readiness-to-launch demonstration
3	Institutional governance and admin controls	Institutional implementation + security	Approval and command infrastructure	Controlled configuration, reconciliation, recovery evidence
4	Investor and board publication workflows	Finance + leadership + corporate secretary	Reconciled sources and disclosure policies	Reviewed packages and audience-isolation tests
5	Alumni lifecycle and relationship workflows	Career/alumni product lead	Affiliation lifecycle and consent	Graduation transition, mentoring and visibility tests
6	Progressive domain replacement	Domain owner + institutional authority	Dual-run, support and rollback readiness	Signed authority transfer and verified operating evidence

Required activation blockers

Do not activate a workspace workflow when any of the following remains unresolved:

- No canonical source or object owner.
- No verified tenant or resource-scope enforcement.
- No approved authority for consequential actions.
- No demonstrated consent or revocation behavior where needed.
- No accessible completion path.
- No support and incident owner.
- No reconciliation or recovery plan for consequential writes.
- No reviewed audience policy for restricted disclosure.
- No evidence that runtime AI policy is enforced.

Capability status ledger

Track each capability independently:

```
designed
implemented
tested
deployed
institution_authorized, where applicable
production_enabled
authoritative_for_domain, where applicable
```

Each status needs an evidence reference, accountable owner, environment, and review date. A completed screen cannot stand in for verified backend behavior or institutional authority; your existing completion definition already requires permissions, tenant scope, accessibility, monitoring, tests, rollback, documentation, and release evidence.[1]

13. First acceptance demonstration

The most useful initial proof is one connected workflow across the company and institutional boundary:

1. Company operator creates an implementation plan from approved scope.
2. Institutional sponsor reviews objectives and responsibilities.
3. Authorized administrator configures only the assigned tenant.
4. Required readiness evidence is attached.
5. The correct institutional authority approves launch.
6. Execution produces a durable receipt and verified resulting state.
7. Outcome reporting uses approved, source-linked aggregates.
8. Management publishes different investor and board packages from reviewed evidence.
9. Unauthorized users cannot retrieve underlying institutional records.

Run a second proof for lifecycle continuity: a student becomes an alumnus, loses expired institutional privileges, retains permitted personal work, and explicitly chooses mentoring and directory participation.

Together, these demonstrations test the central promise: different workspaces, connected work, and enforceable authority—without turning Semester into either disconnected dashboards or one unrestricted administrative console.
