Controlled policy draft

Owner: [assign named authority] | Version: [approve] | Review: [date] | Status: draft

Purpose: govern protected data and consequential actions.

Scope: named tenants, data classes, environments and user roles.

Rules: least privilege; purpose-bound access; default-private artifacts; expiring delegation; approved retention; provider egress allowlist; exact action review and receipt.

Roles: owner, qualified reviewer, authorized decision maker, operator and independent checker.

Exceptions: documented purpose, compensating controls, distinct approver and expiry; no waiver of law or institution authority.

Enforcement: fail closed, minimum audit payload, accountable remediation and retest.

Revision history: version/date/change/authority/evidence. Publish only after review.

Incident/operations runbook draft

Owner/version/review: [complete before operational use]

Trigger: suspected tenant isolation failure, record egress, corrupted projection or critical dependency outage.

Severity: map to canonical Sev1–4; no invented SLA or notification deadline.

First15minutes: incident commander; restrict affected capability; preserve correlation/log evidence; identify tenant/target; page approved security/privacy/support; no sensitive payloads in chat.

Diagnosis: SHA/config/grants/source time/outbox lag/event gap; distinguish confirmed transaction from late projection.

Fix: reviewed scoped remediation, object integrity and source reconciliation.

Rollback: verify schema/data compatibility; app rollback does not reverse committed records. Use accepted target-specific recovery plan.

Comms: audience-specific updates under privacy/counsel and institution authority.

Verification: authorization/isolation/currentness/affected journey/monitoring; retain dated witness record.

Escalation: named primary/backup/qualified reviewer/institution owner. Contacts and recovery objectives not supplied.

Pilot case-study publication template

Status: structure only; no real deployed-pilot results or quotation supplied.

Context: approved institution/cohort/term and reference permission.

Challenge: documented baseline/workflow failure, source and observation coverage.

Deployed: exact accepted capability, candidate/tenant/target; never list prototypes as deployment.

Results: unavailable until measured; numerator/denominator/source/window/method/uncertainty required. Hypothetical examples must say sample, not actual.

Quote: [verbatim authorized quote, person/title, permission/date]; do not invent.

Next: authorized renewal/remediation/stop decision, costs and limitations.

Founding Platform Engineer — proposed role posting

Location/type/reporting: [approve] | Status: draft

Summary: harden connected academic workflows in Semester.

Do: durable commands and event projections, scoped identity/object policy, tenant isolation, accessible operational UX and evidence-based delivery.

First90days: reconcile canonical code; deliver one full reviewed loop; test denial/replay/concurrency; leave traceable handoff and approved recovery evidence.

Must: TypeScript, relational systems, authorization and failure testing, privacy-aware engineering.

Nice: Postgres RLS, institutional integration, manual accessibility, governed AI.

How we work: bounded increments, human authority, no unauthorized external writes.

Compensation: [finance/counsel-approved range/benefits/equity]. Apply: [approved accessible contact].

Semester — institution leave-behind draft

Problem: planning, learning, registration and support span disconnected systems.

Product: one account, Action Center, search, workspace and source-aware intelligence.

Roles: student next action; faculty reviewed authoring/release; staff accountable queues; institution scoped policy/integration/audit.

Pilot: proposed bounded readiness scope with agreed baseline/cohort/responsible offices.

Official boundaries: owning systems retain records and consequential decisions unless a replacement scope is explicitly authorized.

Trust: qualified review and target/professional/customer acceptance required; no certification claim.

Contact: [approved contact]. Do not publish draft prices/outcomes/logos.

Student quick start — Letter guide draft

1. Sign in through permitted identity and institution context. Never use another person's account.

2. Connect approved course sources or start privately; inspect source and age.

3. Choose privacy/AI settings, then complete first safe action in Today.

Source labels: official/connected/personal/estimated/AI-assisted; freshness is separate.

Privacy: family/advisor/support scope and expiry are explicit; revoke anywhere.

Readiness is not enrollment; private what-if is not an official grade.

Help: [approved queue/hours] or owning institutional office. Fill before distribution.

Release notes — this local increment

Scope: synthetic local workflow lab, not deployed Semester product.

Students: onboarding and submission transaction; released synthetic grade projection; readiness with unknown/stale distinction.

Faculty/reviewer: draft score, reasoned release request, exact-current-object independent approval.

Registrar: reasoned hold-clear request and independent review; local prerequisite source confirmation.

Operators: tenant-scoped event counts and outbox processing; no student records in default view.

Tests:34unit tests and a bounded browser/API smoke. Known issues: synthetic tokens, simplified scopes, no production RLS/SSO/provider/AI/financial/final-record authority; no complete gap/lease/dead-letter engine.

What stays same: official systems retain authority; production activation not established.

End-of-term pilot results template

Control: owner/version/cohort/term/accepted target and publication status.

Measures versus baseline: unavailable; require frozen method, denominators, source coverage and uncertainty.

Adoption: invited/activated/firstvalue/active cohorts, retention of observations and lag policy.

Support: case mix/severity, response/resolution distributions, paused reasons and staffing costs.

Trust: security/privacy/accessibility review, incidents, rights requests and unresolved findings.

Recommendation: renew/narrow/remediate/stop against agreed criteria.

Decision: named institutional authority, exact conditions, responsible owners and reference permission.
