Student workspace screen specifications

Status: target UX contracts, not deployed screens. APIs and mutation handlers remain to be implemented.

Common shell

Institution switcher, personal-workspace distinction, permission-aware search, inbox, profile, primary navigation. Deep links preserve destination after authentication. Never expose a faculty/finance workspace based only on an unverified client role flag. On every screen: loading, empty, forbidden, stale-source, offline, failure and success states; labeled inputs, keyboard navigation, accessible feedback. Personal work remains separate from official academic records.

Today /app/student

Purpose: answer what needs attention now. Modules: next class, due assignments, personal tasks, authorized service updates. Primary actions open source records, not rewrite them. Read: authorized aggregation of own records. Ordering combines dates and explicit priorities; no hidden risk labels. Empty state explains adding personal tasks or joining a course. Stale external records show source/time. Acceptance: no peer or cross-tenant records; deadline timezone correct; every card links to authoritative detail.

Courses and course home

List current/past enrollments, term filters, section names. Course home shows only published modules/items/announcements/assignments. Content item publication cannot override an unpublished parent module. Denied/ended enrollments follow institution retention policy. Acceptance: faculty draft never visible to students; wrong section ID denied.

Lesson

Readable content, sources, progress affordance, private note capture. Study progress/AI explanations are not official academic decisions. Download uses storage authorization, not a raw file_reference. Acceptance: published parent and item; safe file handling; readable keyboard flow.

Assignment and submission receipt

Instructions, rubric extension, due date/timezone, allowed attempts, accommodations only as authorized instructions, upload status, draft save, submit confirmation. Server submit_assignment validates enrollment, deadline policy, attempt, file checks, idempotency and current assignment version. Receipt includes attempt/time/status; network uncertainty triggers status lookup before retry. Acceptance: duplicate click does not create another attempt; peers cannot access work.

Grades

Own published grades/feedback. Distinguish working course grade from official institution result. Show correction history appropriate for the student; full grade_revisions is faculty audit only in reference SQL. Review request uses authorized service workflow. No draft grades.

Planner and notes

Private owner-scoped tasks/events/notes, due dates, completion. Course deadlines are linked references, not overwritten authoritative assignment dates. These personal tables do not depend on institutional membership; account-level suspension rules require additional policy if needed. Collaboration/sharing is not included in reference schema.

Advising and services

Service catalog, own requests, assigned staff, appointments, status timeline. No other student's case and no unrestricted wellbeing/accommodation records. Restricted service specialties require separate domain models. Appointment confirmation/error announced and scheduling conflicts validated server-side.

Account and privacy

Student account shows only verified personal or student-account data. Institution's commercial SaaS account is visible only to explicit billing contacts, not every student. Tuition/aid is a separate unimplemented finance domain. Privacy handles export/sharing/request state; full privacy tables/commands are an extension, not supplied by this SQL.
