show me Semester AI outline descibe and go through and explain and detail all semester AI cappblties and functions

Semester AI is a student-focused Android app from Bawano Technologies that combines AI-assisted PDF reading, document organization, course communities, and tutoring. Its Google Play listing calls it "Semester AI – Reader, Tutors"; below is a breakdown of its publicly documented capabilities—not a claim that I have tested every feature.[1]

1. AI reading and documents

Semester AI's central feature is a PDF reader with an AI reading companion. The developer describes the following functions.[1]

Function	What it does	How you would use it
Open and browse PDFs	Provides an in-app PDF viewer.	Read lecture notes, assigned readings, or other PDF course materials.
Create PDFs	The listing says you can create PDF documents, but does not explain the creation options.	Prepare documents for reading within the app.
Ask questions about content	Lets you ask the AI about material you do not understand.	Ask for an explanation of a difficult passage while reading.
Summarize PDFs	Uses the reading companion to summarize document content.	Request a condensed explanation of a reading.
Convert Word to PDF	Converts Word documents into PDFs for viewing and AI interaction.	Bring Word-based class materials into the PDF workflow.

All five functions are described in the developer's listing. It does not specify supported file sizes, Word formats, scanned-PDF recognition accuracy, or whether AI answers include page-level citations.[1]

Example: For a software-engineering reading, a possible question would be: "Explain the difference between coupling and cohesion in this document, then summarize the author's main points." This illustrates how the advertised question-answering and summarization features could be used; it is not a tested result.

2. Notes and file management

Beyond reading, Semester AI advertises tools for turning notes into digital materials, editing them, and keeping them accessible. [1]

Function	Documented capability	Important distinction
Note scanning	Capture notes using the app's scanning feature.	The listing does not specify handwriting accuracy.
AI-assisted digitization	Transform captured notes into organized digital content.	The exact organization and extraction methods are not explained.
Note enhancement and editing	Enhance and edit notes digitally with AI-generated insights.	Specific editing commands are not listed.
Annotation	Annotate digital notes.	Available annotation types are not specified.
Document backup	Back up documents.	Storage quotas and retention policies are not stated in the description.
Cross-device synchronization	Synchronize documents across devices.	This does not establish that native iOS or desktop apps exist.
Document sharing	Share documents and classwork with other Semester AI users.	Sharing permissions and public-link options are not described.

These are advertised functions, rather than independently verified performance claims. [1]

A possible workflow is to scan class notes, review the resulting digital content, annotate it, and share it with classmates. Those individual steps are supported by the listing, but automatic execution of the entire workflow is not documented. [1]

3. Courses and collaboration

Semester AI also presents itself as a learning community organized around universities and courses—not just a standalone chatbot. [1]

- University catalog: Browse an "ever-growing" catalog of universities and their courses; the listing gives no institution count or coverage list. [1]
- University and course membership: Join your university and course to connect with other learners. [1]
- Course-material sharing: Exchange notes and documents with classmates and read together. [1]
- Cross-university connections: Meet coursemates from different universities for collaboration. [1]
- In-app chat: Discuss material and communicate with other users. [1]
- Study groups: Initiate study groups, share resources, and work through challenges together. The description does not explain whether groups have dedicated administration tools. [1]

The distinction matters: joining a course community is not the same as integrating with an official university system. The listing does not establish enrollment verification, automatic course imports, grade access, or connections to Canvas, Blackboard, Moodle, or other learning-management systems. [1]

4. AI and human tutors

The developer advertises an expanding catalog of course-specific AI and human tutors, described as available for consultation and questions "24/7." However, the listing does not explain how that availability works or guarantee immediate access to a human tutor. [1]

Tutor capability	What is documented	What remains unclear
Course-specific AI tutoring	AI tutors associated with courses.	Which subjects are covered, how tutors use course materials, and how answers are checked.
Human tutoring	Access to a catalog that includes human tutors.	Tutor qualifications, scheduling, fees, and response times.
Question-based help	Consult tutors and ask questions.	Whether sessions support video, audio, screen sharing, or only text.
Ongoing availability	The catalog is marketed as available 24/7.	Whether this refers to AI access, browsing the catalog, or live human service.

The description supports tutoring as a product category, but not detailed claims about adaptive teaching, mastery tracking, automated grading, or personalized study plans. [1]

5. Limits and practical details

Is it an agentic AI?

The public description supports an AI-assisted study app. It does **not** establish an autonomous agent that plans and executes multi-step tasks across external services. There is no documented ability to send emails, manage your calendar, submit assignments, run code, operate a browser, or connect to GitHub, Google Drive, Supabase, or Vercel. "Not documented" does not necessarily mean absent—it means those abilities cannot be confirmed from this listing. [1]

Features not firmly established

The search result preview mentioned quizzes, flashcards, and learning games, but the retrieved full store description did not include those features. I would treat them as **unconfirmed**, rather than promise they are currently available. Audio listening is likewise not explained in the retrieved description. [1]

Other details not established by the listing include:

- The underlying AI model, context limits, and answer accuracy.
- Offline AI operation and supported languages.
- Pricing tiers, AI usage allowances, and storage limits.

- APIs, third-party integrations, or developer automation features.
- Exam scheduling, grade tracking, and assignment submission. [1]

Availability and privacy

The retrieved Google Play page shows 1K+ downloads, ads, in-app purchases, and a last-update date of April 18, 2025. It does not provide a detailed subscription price list in the retrieved content. [1]

In its developer-provided data-safety disclosures, the app says it may collect location, personal information, and seven other data categories; it declares no third-party data sharing, encryption in transit, and the ability to request deletion. These are developer declarations, not an independent privacy audit. [1]

The two most distinctive documented capabilities are document-grounded reading help and course-based collaboration: the first helps you work through your materials, while the second connects those materials to classmates and tutors. Neither should be confused with a general-purpose autonomous AI agent. [1]
