Semester should be designed as one connected **Education OS** with a student-facing Inter App, a staff-facing Institution OS, and a leadership/business layer that manages operations, lifecycle transitions, and analytics. Current higher-ed platforms increasingly connect advising, applicant portals, registration, communications, and student-success workflows in one system rather than separate disconnected tools. [1] [2] [3]

Platform structure

Use three product layers that share one identity graph and lifecycle record. Advising, registration, admissions, communications, and planning work best when they operate on the same student record and connected care-team workflow. [4] [5] [1]

Layer	Primary audience	Core purpose
Semester Inter App	Applicants, students, alumni	Daily experience: profile, portfolio, announcements, messaging, tasks, planning
Institution OS	Admissions, registrar, advisors, student affairs, support teams	Workflows, approvals, casework, outreach, service delivery
Business OS	Leadership, ops, enrollment, analytics teams	Funnel reporting, performance, automation, governance
Education OS	Shared platform layer	Identity, lifecycle state, rules engine, integrations, communications, analytics

Semester Inter App

The Inter App should be the daily front door for campus life, academic planning, and student support. Student-facing platforms increasingly combine communication, mobile tasks, appointments, guidance, and planning in a single app experience. [2] [5] [1]

Main app modules

- Home feed for announcements, tasks, deadlines, and reminders.
- Public/private profile and portfolio.
- Direct messages with peers, advisors, offices, and communities.
- Course planning and registration view.
- Advising center with appointments, notes, alerts, and plans.
- Applicant or enrollment tasks depending on lifecycle stage.
- Communities for clubs, cohorts, residence, and departments.
- Service center for registrar, aid, tutoring, IT, and advising.

Personal profile and portfolio

Profiles should support both identity and opportunity sharing.

Profile area	What it includes
Public profile	Name, photo, headline, bio, public portfolio items, achievements
Campus profile	Major, class year, clubs, campus interests, internal networking details
Private profile	Contact info, personal settings, direct-message permissions
Portfolio	Projects, presentations, research, writing, resume items, links, media
Visibility controls	Per-field toggles for public, campus-only, connections-only, private

Students should be able to present themselves differently for campus community, academic collaboration, and professional opportunity discovery. Platforms focused on student engagement and advising increasingly emphasize the value of complete student profiles, connected planning, and student-facing app experiences. [1] [4]

Posting and sharing model

The profile layer should support:

- Public posts for portfolio updates and accomplishments.
- Campus-only posts for peer networking.
- Private notes or saved drafts.
- Shared project cards with links, media, and collaborators.
- Achievement badges tied to clubs, leadership, or milestones.
- Profile cards that can be shared to employers, advisors, or campus groups.

A good model is:

```
Create content
  → Select type: post / project / achievement / update
  → Select visibility: public / campus / group / private
```

```
  → Add media, links, tags
  → Publish
  → Appear on profile + feeds according to audience rules
```

Admissions center and applicant portal

The admissions center should manage a person from first inquiry through application, review, decision, deposit, and enrollment. Integrated lifecycle platforms stress that recruitment, application, and current-student support should connect rather than restart from scratch after admission. [2] [1]

Applicant lifecycle

```
Prospect
  → Inquiry
  → Applicant account
  → Application started
  → Documents collected
  → Review in progress
  → Decision
  → Admitted
  → Deposit / confirm
  → Onboarding
  → Enrolled student
```

Applicant portal features

Feature	Description
Account setup	Identity verification, passwordless sign-in or MFA
Application builder	Multi-step forms, essays, uploads, save/resume
Checklist	Missing materials, recommendations, transcript status
Counselor messaging	Direct contact with admissions staff
Status tracker	Clear stage labels and expected next steps
Events and appointments	Tours, info sessions, counselor meetings
Deposit and forms	Confirmation fee, housing, orientation, next-step forms
Transition hub	Hand-off into advising, registration prep, and student onboarding

Admissions and lifecycle systems increasingly offer 360-degree prospect profiles, communications, events, application tools, and a connected portal that extends into enrollment. [1] [2]

Transition to enrolled student

The transition should be an orchestrated status handoff, not a manual import. Integrated lifecycle models stress continuity from pre-enrollment history into the current student profile so staff and students keep context through the handoff. [2] [1]

Transition workflow

- Convert applicant identity into enrolled-student identity without creating a disconnected new record.
- Carry forward pre-enrollment history, communications, forms, and milestones.
- Generate student ID, portal permissions, and app access.
- Activate advising assignment, orientation tasks, and registration windows.
- Shift communications from admissions campaigns to student-success guidance.
- Open academic planning, holds center, and service navigation.

Lifecycle record states

State	Primary system	Student-facing experience
Prospect	CRM/admissions center	Inquiry content, events, early messaging
Applicant	Applicant portal	Forms, checklist, status, counselor communication
Admitted	Admit center	Offer, deposit, onboarding steps
Matriculating	Institution OS + Inter App	Orientation, advising setup, registration prep
Enrolled	SIS + Inter App	Schedule, degree plan, advising, campus engagement

Registration and student operations console

Registration should be part of a broader student operations console rather than a standalone tool. Institutions commonly connect registration with advising, holds, eligibility, academic planning, and support resources so students can act from one hub. [6] [5]

Registration features

- Course search and filtering.
- Degree-requirement-aware schedule builder.
- Shopping cart and saved plans.
- Time-ticket and registration window handling.
- Prerequisite, co-requisite, and seat checks.
- Waitlist, swap, add, and drop flows.
- Hold visibility and action guidance.
- Billing and compliance warnings tied to registration actions.

Student operations console

Area	Functions
Registration	Search, cart, enroll, swap, waitlist, drop
Academics	Schedule, grades, transcript view, milestones
Holds center	Registration, financial, advising, immunization, conduct holds
Student services	Cases, requests, forms, office contact, queue routing
Documents	Enrollment letters, forms, approvals, uploaded records
Communication	Notices, reminders, task-based nudges

Vanderbilt's student registration guidance shows the practical model: students view course offerings, use a cart, learn their registration windows, and coordinate with an advisor through the same enrollment services environment. [6]

Advising functions

Advising should be treated as a full campus support system, not just appointment booking. Current advising platforms consistently emphasize complete student profiles, coordinated care networks, early alerts, appointments, notes, degree planning, and integrated outreach. [3] [4] [1]

Core advising features

Feature	What it does
Advisor assignment	Shows each student's assigned advisor or care team
Appointment scheduling	Students book time based on actual advisor availability
Degree planning	Students and advisors build multi-term plans
Degree audit	Shows completed, in-progress, and remaining requirements
Early alerts	Flags missed registration, low grades, attendance or risk signals
Notes and attachments	Shared advising notes, documents, and follow-ups
Cases and referrals	Route students to tutoring, aid, counseling, disability support
Messaging	Advisor-student direct communication and outreach campaigns
Tasks and nudges	Checklists for forms, planning, holds, or key milestones
Progress dashboards	View academic risk, engagement, and completion pathway

Advising workflow

```
Student assigned to advisor
  → Student completes intake / goals
  → Advisor reviews profile, degree progress, alerts
  → Appointment scheduled
  → Advisor creates or updates academic plan
```

```
   → Tasks, referrals, and follow-ups assigned
   → Student receives nudges and completes actions
   → Risk or progress monitored continuously
```

Advising dashboard for students

Students should see:

- Their assigned advisor and care team.
- Upcoming appointments.
- Current holds and action items.
- Degree progress and recommended next courses.
- Advising notes approved for student view.
- Referrals and support resources.
- Registration readiness checklist.

Advising dashboard for staff

Advisors should see:

- Caseload by risk and urgency.
- Student profile with pre-enrollment and current history.
- Degree progress and future planning.
- Appointment queue and no-show patterns.
- Alerts, referrals, and interventions.
- Communication history across email, text, and in-app.
- Cohort trends and unresolved barriers.

EAB highlights coordinated care networks, cases and referrals, appointments, campaigns, and holds-center style features, while Workday and other advising platforms emphasize academic progress, planning templates, eligibility rules, and advisor scheduling. [5] [1]

Institution OS

Institution OS is the staff operating environment for managing academic and student workflows. Advising, admissions, and student-support vendors increasingly position this as a shared workspace where multiple offices collaborate around a student record and intervention history. [7] [4] [3]

Core Institution OS workspaces

- Admissions center.
- Registrar and scheduling console.
- Advising and student success hub.
- Student affairs and engagement operations.
- Communications and campaign center.
- Case management and service routing.
- Document and workflow approvals.
- Reporting and compliance dashboards.

Key design principle

Institution OS should support **coordinated care**, meaning multiple offices can work on the same student case with role-based permissions, notes, referrals, and outcome tracking. That coordinated-care approach is explicitly emphasized in modern student-success platforms. [1] [2]

Business OS

Business OS is the management layer for institutional performance and operational control. It should aggregate funnel, retention, communication, and service data into one decision surface. Integrated lifecycle systems increasingly connect enrollment, student success, and engagement analytics for operational decision-making. [2] [1]

Business OS features

- Inquiry-to-enrollment funnel reporting.
- Admit-to-matriculation conversion tracking.
- Registration and retention health dashboards.
- Advising workload and appointment analytics.
- Communication performance by segment and campaign.
- Intervention outcomes and service-level agreements.
- Cohort trend analysis by college, program, and risk type.
- Institutional planning and forecasting.

Education OS

Education OS is the shared platform layer under everything else. A unified SIS- and CRM-connected system is valuable because schools need one source of truth for communications, planning, records, and support workflows. [4] [3] [1]

Education OS foundation services

Service	Purpose
Identity graph	One person record across prospect, applicant, student, alumni
Lifecycle engine	Stage transitions, permissions, and triggered workflows
Rules engine	Eligibility, holds, routing, role-based visibility
Notification hub	In-app, email, SMS, and push orchestration
Integration layer	SIS, LMS, CRM, payments, calendar, SSO
Analytics layer	Cross-lifecycle reporting and student-success insights
Audit and compliance	FERPA-aware logging, permissions, retention policies

End-to-end example

A Semester journey should look like this:

1. A prospect creates a profile and receives admissions communications in the Inter App or portal. [1]
2. They submit an application, track missing materials, and message admissions. [2] [1]
3. Once admitted, their portal becomes an onboarding and transition hub.
4. Advisor assignment, degree planning, and registration prep are activated before first-term enrollment. [5] [6]
5. After matriculation, the same person uses the Inter App for announcements, profile sharing, portfolio posting, class registration, advising, and campus engagement. [4] [1]
6. Institution OS teams continue to support them through coordinated advising, alerts, and referrals. [3] [7]

Recommended Semester module map

Product	Major modules
Inter App	Feed, profile, portfolio, messaging, communities, tasks, advising, registration, services
Applicant Portal	Apply, upload, checklist, counselor messaging, events, decision, onboarding
Student Portal	Schedule, registration, degree progress, holds, forms, finances, services
Advising Hub	Appointments, plans, audits, notes, alerts, referrals, campaigns
Institution OS	Admissions, registrar, student success, casework, communications, operations
Business OS	Funnel analytics, retention, workload, campaign reporting, governance
Education OS	Identity, lifecycle, integrations, notification hub, rules, audit

The strongest product framing is that Semester is one lifecycle platform with specialized surfaces for students, applicants, advisors, and operators. That aligns with how current higher-

ed vendors describe unified student engagement, advising, and lifecycle orchestration from inquiry to completion.[3] [1] [2]

Would you like the next step to be a full ER data model and workflow spec for advising, admissions, registration, profiles, and the Inter App together?
