Review notes

Fresh-database reference, not an upgrade to the earlier 129-table schema. Do not apply both schemas together. Shared dependencies are reduced portal-facing records, especially billing and payments. No PostgreSQL execution or tests were performed here.

All tables have default-deny forced RLS and no permissive policies. Implement reviewed identity-backed policies, grants and server commands before runtime use. Database administrators and BYPASSRLS roles remain privileged.

Ten baseline pgTAP assertions are supplied, not a complete production authorization suite. Empty housing/dining assertions are baseline only; populate runtime fixtures and test positive own-tenant access, other-tenant denial, same-tenant ownership, advisor and faculty scope, exports, storage, role revocation, and concurrent mutations. Run fixture setup in an isolated sandbox as an administrator capable of bypassing RLS. pgTAP is assumed installed in public. Test role must not already exist. No changes survive the rollback.

Required command checks: same-cycle roommates; same-application assignment consistency; allocation expiry inside locked confirmation; native spend atomicity and overdraft prevention; funding account ownership; valid benefits/location/date; refunds and allocation sums; matching-account reversals; immutable publication/signature workflows; validated JSON rules; no client-authoritative legal basis or consent. Grants in plan benefits are templates; posted entitlement entries determine native balances. Connected balances remain external authority.

Retention safeguards must be applied to the full governance schema, not this reduced housing/dining schema. Statutory disclosure records and operational logs require different approved retention rules. Protect required records while education records remain and while applicable requests or holds are active. Revoke TRUNCATE, log approved disposition, and coordinate concurrent hold placement with deletion.
